<u>Details</u>:

I am looking for assistance with a small wordpress project to integrate custom post types into a plugin post type. I have a limited project budget, so it would be great if you could let me know how you charge for your services.

Here is a description of the project:

I have made a website for firefighters of the Amherst Fire Department to help organize their activities and simplify their needs to one website. The fire department has many members that are not so good with computers, so everything needs to be changeable from the *front end of the website*.

1. The fire department has many different types of events that need to be cataloged in the website: Meetings, trainings, emergency calls, etc. I have created custom post types so that users can create and edit the information associated with these events. I have created these custom post types using the Toolset plugins.

2. In order to organize these custom post types, I would like to arrange them on a calendar, as this is the most logical way to arrange the custom post types. I am currently using EventON plugin as an events manager on my website. This plugin needs to be able to display all events that the department has, this plugin has a front-end management system to manage event fields called *action user* I am using this as well.

The service that I need help with is *integrating the custom post types with the EventON plugin.* I need it to be so that when somebody creates a "meeting" custom post type, that it displays on the *EventON calendar without any further action.*

EventON documentation (including hooks and post meta): http://www.myeventon.com/documentation/

The eventON calendar now has the filter option displayed. Settings can be found at "Sorting and Filtering" in the eventON settingshttp://afrm.amherstnh.gov/wp-admin/admin.php?page=eventon#evcal_001a

One last piece of information, I have found where Woffice's "projects" extension hooks to the EventON plugin.

Deliverables:

Deliverable: Sync data created through Custom post type plugin (TOOL SET) with EVENT ON plugin which means presenting the data in frontend through EVENT ON calendar plugin should work automatically by its default settings.

Any help required in presenting the data using EVENT ON plugin will be done only by using the default settings available in it. No code work will be done for presenting the data in frontend.
